PROFESSIONAL SUMMARY

Focused on building production-ready AI systems, not just models.

AI Systems Builder focused on developing scalable, real-world machine learning applications. Experienced in building end-to-end ML pipelines, multi-agent AI systems, and data-driven solutions across domains like cybersecurity, finance, and customer analytics.
Skilled in Python, backend systems, and deploying intelligent applications that prioritize performance, accuracy, and real-world impact.

TECHNICAL SKILLS

Programming: Python, SQL, Java
Data Analytics: Data Cleaning, Wrangling, EDA, Data Validation
SQL Skills: Joins, Subqueries, Aggregations, Group By, Window Functions, Stored Procedures
Visualization Tools: Tableau / Power BI
Libraries: Pandas, NumPy, Scikit-learn
Data Concepts: Data Warehousing, ETL Pipelines, Relational Databases
Cloud (Basic Knowledge): GCP fundamentals
Core Concepts: Data Structures, DBMS, Computer Networks

EDUCATION

Bachelor of Technology (B.Tech) in Computer Science Pursuing
PES University, Bangalore
Diploma - Government Polytechnic, Hubli 2024
SSLC (10th Grade, KSEEB) 2020

PROJECTS

1. Customer Segmentation for Telco Retention
   • Built an end-to-end ML pipeline using K-Means clustering to segment telecom customers
   • Applied PCA for dimensionality reduction, improving cluster interpretability
   • Identified high-risk churn segments, enabling data-driven retention strategies
   • Processed and cleaned real-world customer datasets using Python (Pandas, NumPy)
2. Hybrid Hangman – AI-Based Word Prediction System
   • Developed an AI-powered word prediction system using Hidden Markov Models (HMM) and Deep Q-Networks (DQN)
   • Designed reinforcement learning agent to improve guessing accuracy over time
   • Evaluated performance using success rate and convergence metrics
   • Combined probabilistic and RL approaches for improved prediction efficiency
3. Multi-Agent AI System using LangGraph
   • Built a multi-agent system with Planner, Researcher, Writer, and Critic agents using LangGraph
   • Designed orchestration pipeline: user input → planning → execution → evaluation → refined output
   • Enabled collaborative agent workflows to iteratively improve responses
   • Integrated LLM-based reasoning with modular architecture for scalability
   • Demonstrates real-world AI system design beyond single-model applications

CERTIFICATIONS

- Oracle Cloud Infrastructure 2025 – Generative AI Professional
- Hackathon Participant : Heal-O-Code 2.0 (AI / Healthcare Domain)
- Python & Data Science (Udemy)
- Cyber Security (EDL)
